What type of battery does Bess use?

The most commonly used battery types in BESS include: Lithium-ion(Li-ion): Known for its high energy density, commonly used in electric vehicles and grid energy storage. Lead-acid battery: More affordable, but with lower efficiency and a shorter lifespan. Flow battery (e.g., all-vanadium flow battery): Ideal for long-term energy storage.

What is Bess & how does it work?

BESS stores surplus energy generated from renewable energy sources such as wind and solar. This stored energy can be released when demand exceeds production. This technology plays a crucial role in integrating renewable energy into our electricity grids by helping to address the inherent supply-demand imbalance of intermittent renewable sources. 2.

Why should you choose a Bess energy storage system?

The mobility and flexibility of the system enables novel applications and deployments where BESS previously were unused due to the non-flexible solutions. The system is modular, meaning that the energy storage capacity can be quickly adapted depending on the application case, in contrast to larger and bulkier solutions.

How much power does a Bess have?

The system is built of two main blocks. The PCS building block, responsible for the main control of the mobile BESS. The nominal power rating of the PCS block is 225 kVA, with a maximum peak power in the peak shaving mode of 275 kW. The second block is the modular battery pack.
