---

The modeling results of the drying process indicate that utilizing a low-boiling-point solvent (DMF) instead of NMP can reduce the drying energy consumption fourfold, resulting in a more ...

A German recycler developed a hybrid distillation-adsorption system tailored for lithium battery NMP, achieving 99.5% purity with 40% lower energy use than conventional methods, directly ...

The adsorption wheel is designed to capture N-Methyl-2-pyrrolidone (nMP) and other volatile organic compounds (VOCs) and hazardous air pollutants (HAPs) from battery manufacturing ...

In this article we'll look at how recycling N-Methyl-2-Pyrrolidone (NMP) can make battery manufacturing more sustainable - and bring cost savings too.

Various methods can be employed to facilitate the circulation of solar energy mediums. One fundamental approach is utilizing energy ...

One key player in the battery manufacturing process is N-Methyl-2-pyrrolidone, commonly known as NMP. This solvent plays an essential role in the production of lithium-ion ...
